Mole Scram™ is an organic, granular repellent used to reduce and eliminate moles from your lawn. It is also an excellent PREVENTIVE MEASURE when used in the spring and fall. Mole Scram™ will safely and naturally stop mole infestation if used as directed. Mole Scram is GUARANTEED to work.

APPLICATION INSTRUCTIONS

GENERAL APPLICATION:
Using the shaker container or rotary spreader, cover the entire area where moles are present with two phased applications, which will drive moles out of affected areas.
Apply Mole Scram Day 1 to 50% of lawn starting at the area furthest from where you want the moles to exit, then water for approximately 20 minutes.
On Day 2, apply Mole Scram to the remaining 50% of the affected lawn, then water in the same way.

Where possible, locate mole runways, then punch 1” holes every 10 ft., then drop granules into the holes and cover with soil. Also apply to the end of each runway.
Apply 1 lb. per 750 sq. ft.

COVERAGE:
A 4.5 lb. container will protect approx. 3,375 sq. ft.

FREQUENCY OF USE:
Mole Scram should be applied at the beginning of Spring and then Fall, the two highest mole activity seasons.
Moles may not exit your property when repelling them, regardless of the repellent used. They may burrow underground up to 5 ft. to avoid the repelling action. As a result, you may have to reapply in the summer if heavy rainfalls occur and bring earthworms to the surface. Earthworm surface activity may attract moles as the worms are so important a part of moles’ diets. However, mole damage will be greatly reduced through the use of Mole Scram, which will cause them to dig food runs and tunnels in a more attractive environment elsewhere.

GENERAL INFORMATION:
Mole Scram is a proprietary blend of natural and organic biodegradable ingredients specifically designed to reduce and eliminate mole activity. Our all-natural organic repellent contains more active ingredients that make it twice as strong as other repellents. While Mole Scram is fast acting, it may take a few days for moles to associate their discomfort with the treated areas. Mole Scram is both organic and biodegradable and will naturally break down over time.

NOTE: Watering or rainfall is the key to activation as it draws the active oils from the granules into the soil. This action rapidly begins the repelling process.

WHAT YOU SHOULD KNOW ABOUT THE MOLE:
The mole lives primarily underground. One mole may damage an entire lawn up to one acre in size. The mole’s main food is the earthworm which is 80% to 90% of their diet, followed by insects and grubs. Mole Scram’s triple action formula coats earthworms and other insect food with a digestive system irritant, & also makes their environment smell disagreeable. Lastly, Mole Scram reduces the activity and presence of insects (another part of moles’ diets) within treated areas.
